

Operational Analysis Report: GASO Petroleum

Executive Summary

GASO Petroleum's filling station has demonstrated a strong financial performance for the analyzed period, generating a total revenue of 5.87 million while maintaining highly efficient operations with an expense-to-sales ratio of only 0.03. This efficiency is evidenced by the total operational expenses of 179.03 thousand against a total sales volume of 441.08 thousand litres of fuel.

Operational Performance & Financial Health

The station's primary revenue stream is cash-based, accounting for 5.32 million in sales, complemented by a modest credit portfolio of 53.48 thousand, which is largely attributed to institutional clients such as Carbon Logistics. Despite this strong revenue foundation, the operation faces minor challenges in inventory and banking management; a net tank variance of approximately 3,222 units indicates a discrepancy between expected and actual stock levels, while a banking variance of 1.44 thousand suggests that reconciliation procedures between expected and actual banked amounts require continued oversight.

Conclusion

Overall, the filling station exhibits robust profitability and lean management, with the identified variances in inventory and banking serving as key focus areas to optimize future operational accuracy and maximize net returns.
